

FEATURES

Temperature coefficient: 5 ppm/°C maximum
 High output current: 30 mA
 Low supply current: 50 μ A maximum
 Initial accuracy: 2.050 V maximum
 Sleep mode: 15 μ A maximum
 Low dropout voltage
 Load regulation: 4 ppm/mA typical at $T_A = 25^\circ\text{C}$
 Line regulation: 2 ppm/V typical at $T_A = 25^\circ\text{C}$
 Short-circuit protection

ENHANCED PRODUCT FEATURES

Supports defense and aerospace applications (AQEC standard)
 Military temperature range: -55°C to $+125^\circ\text{C}$
 Controlled manufacturing baseline
 1 assembly/test site
 1 fabrication site
 Product change notification
 Qualification data available on request

APPLICATIONS

Portable instruments
 ADCs and DACs
 Smart sensors
 Solar powered applications
 Loop current powered instruments

GENERAL DESCRIPTION

The REF191-EP precision band gap voltage reference uses a proprietary temperature drift curvature correction circuit and laser trimming of highly stable, thin film resistors to achieve a very low temperature coefficient and high initial accuracy.

The REF191-EP is a micropower, low dropout voltage device, providing stable output voltage from supplies with low headroom and consuming less than 50 μ A of supply current. In sleep mode, which is enabled by applying a low transistor to transistor logic (TTL) or complementary metal-oxide semiconductor (CMOS) level to the SLEEP pin, the output is turned off and supply current is further reduced to less than 15 μ A.

The REF191-EP reference is specified over the full military temperature range (-55°C to $+125^\circ\text{C}$).

NOTES

1. NIC = NO INTERNAL CONNECTION.
2. TP PINS ARE FACTORY TEST POINTS, NO USER CONNECTION.

Figure 1.

The REF191-EP is available in an 8-lead SOIC package.

Pin 1 and Pin 5 (TP) are reserved for in package Zener zaps. To achieve the highest level of accuracy at the output, the Zener zapping technique is used to trim the output voltage. Because each unit may require a different amount of adjustment, the resistance value at the test pins varies widely from pin to pin and from device to device. Leave Pin 1 and Pin 5 unconnected.

Additional application and technical information can be found in the [REF19x Series](#) data sheet.

¹ For proper operation, a 1 μF capacitor is required between the output pin and the GND pin of the device.

² TCV_O is defined as the ratio of the output voltage change (between the maximum output voltage (V_{MAX}) and the minimum output voltage (V_{MIN})) with temperature variation to the specified temperature range, expressed in ppm/ $^\circ\text{C}$.

$$TCV_O = (V_{MAX} - V_{MIN}) / V_O (T_{MAX} - T_{MIN})$$

³ Line and load regulation specifications include the effect of self heating.

At $V_S = 3.3\text{ V}$, $-55^\circ\text{C} \leq T_A \leq +125^\circ\text{C}$, unless otherwise noted.

ABSOLUTE MAXIMUM RATINGS

Table 4.

Parameter	Rating
Supply Voltage	−0.3 V to +18 V
Output to GND	−0.3 V to $V_S + 0.3$ V
Output to GND Short-Circuit Duration	Indefinite
Temperature Ranges	
Storage	−65°C to +150°C
Operating	−55°C to +125°C
Junction	−65°C to +150°C
Lead Temperature (Soldering 60 sec)	260°C

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

Thermal performance is directly linked to printed circuit board (PCB) design and operating environment. Careful attention to PCB thermal design is required.

θ_{JA} is the natural convection junction to ambient thermal resistance measured in a one cubic foot sealed enclosure. θ_{JC} is the junction to case thermal resistance.

Table 5. Thermal Resistance

Package Type ¹	θ_{JA}	θ_{JC}	Unit
R-8	158	43	°C/W

¹ Thermal impedance simulated values are based on JEDEC specifications. Use these values in compliance with JESD51-12.

ESD CAUTION

ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.
