

General Description

The ICS874208I is a high-performance differential LVDS clock divider and fanout buffer. The device is designed for the frequency division and signal fanout of high-frequency, low phase-noise clocks. The ICS874208I is characterized to operate from a 2.5V power supply. Guaranteed output-to-output and part-to-part skew characteristics make the ICS874208I ideal for those clock distribution applications demanding well-defined performance and repeatability. The integrated input termination resistors make interfacing to the reference source easy and reduce passive component count. Each output can be individually enabled or disabled in the high-impedance state controlled by a I²C register. On power-up, all outputs are enabled.

Features

- One differential input reference clock
- Differential pair can accept the following differential input levels: LVDS, LVPECL, CML
- Integrated input termination resistors
- Eight LVDS outputs
- Selectable clock frequency division of $\div 1$, $\div 2$, $\div 4$ and $\div 8$
- Maximum input clock frequency: 500MHz
- LVC MOS interface levels for the control inputs
- Internal regulator for improved noise immunity
- Individual output enable/disable by I²C interface
- Output skew: 28ps
- Additive Phase Jitter, RMS: 0.168ps (typical), 125MHz
- Low additive phase jitter
- Full 2.5V supply voltage
- Available in Lead-free (RoHS 6) package
- -40°C to 85°C ambient operating temperature

Table 1. Pin Descriptions

Number	Name	Type		Description
1, 32	ADR1, ADR0	Input	Pulldown	I ² C Address inputs. LVCMOS/LVTTL compatible interface levels.
2, 7, 18, 23	GND	Power		Power supply ground.
3, 4	Q0, nQ0	Output		Differential output pair 0. LVDS interface levels.
5, 6	Q1, nQ1	Output		Differential output pair 1. LVDS interface levels.
8, 17	V _{DDO}	Power		Output power supply pins.
9, 10	Q2, nQ2	Output		Differential output pair 2. LVDS interface levels.
11, 12	Q3, nQ3	Output		Differential output pair 3. LVDS interface levels.
13, 14	Q4, nQ4	Output		Differential output pair 4. LVDS interface levels.
15, 16	Q5, nQ5	Output		Differential output pair 5. LVDS interface levels.
19, 20	Q6, nQ6	Output		Differential output pair 6. LVDS interface levels.
21, 22	Q7, nQ7	Output		Differential output pair 7. LVDS interface levels.
24, 25	FSEL0, FSEL1	Input	Pulldown	Frequency divider select controls. See Table 3A for function. LVCMOS/LVTTL interface levels.
26	IN	Input		Non-inverting differential clock input.
27	V _T	Termination input		Input for termination. Both IN and nIN inputs are internally terminated 50Ω to this pin. See input termination information in the applications section.
28	nIN	Input		Inverting differential clock input.
29	V _{DD}	Power		Power supply pins.
30	SDA	I/O	Pullup	I ² C Data Input/Output. Input: LVCMOS/LVTTL interface levels. Output: open drain.
31	SCL	Input	Pullup	I ² C clock input. LVCMOS/LVTTL compatible interface levels.

NOTE: *Pulldown* and *Pullup* refers to an internal input resistors. See Table 2, *Pin Characteristics*, for typical values.

Table 2. Pin Characteristics

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
C _{IN}	Input Capacitance			4		pF
R _{PULLDOWN}	Input Pulldown Resistor			51		kΩ
R _{PULLUP}	Input Pullup Resistor			51		kΩ

Function Tables

Input Frequency Divider Operation

The FSEL1 and FSEL0 controls configure the input frequency divider. In the default state (FSEL[1:0] are set to logic 0:0 or left open) the output frequency is equal to the input frequency (divide-by-1). The other FSEL[1:0] settings configure the input divider to ÷2, ÷4 or ÷8, respectively.

Table 3A. FSEL[1:0] Input Selection Function Table

Input		Operation
FSEL1	FSEL0	
0 (default)	0 (default)	$f_{Q[7:0]} = f_{REF} \div 1$
0	1	$f_{Q[7:0]} = f_{REF} \div 2$
1	0	$f_{Q[7:0]} = f_{REF} \div 4$
1	1	$f_{Q[7:0]} = f_{REF} \div 8$

NOTE: FSEL1, FSEL0 are asynchronous controls

Output Enable Operation

The output enable/disable state of each individual differential output Qx can be set by the content of the I²C register (see Table 3C). A logic zero to an I²C bit in register 0 enables the corresponding differential output, while a logic one disables the differential output (see Table 3B). After each power cycle, the device resets all I²C bits (D[7:0]) to its default state (logic 0) and all Qx outputs are enabled. After the first valid I²C write, the output enable state is controlled by the I²C register. Setting and changing the output enable state through the I²C interface is asynchronous to the input reference clock.

Table 3B. Individual Output Enable Control

Bit	Operation
D[7:0]	
0 (default)	Output Qx, nQx is enabled.
1	Output Qx, nQx is high-impedance.

Table 3C. Individual output enable control

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Output	Q7	Q6	Q5	Q4	Q3	Q2	Q1	Q0
Default	0	0	0	0	0	0	0	0

I²C Interface Protocol

The ICS874208I uses an I²C slave interface for writing and reading the device configuration to and from the on-chip configuration registers. This device uses the standard I²C write format for a write transaction, and a standard I²C read format for a read transaction. Figure 1 defines the I²C elements of the standard I²C transaction. These elements consist of a start bit, data bytes, an acknowledge or Not-Acknowledge bit and the stop bit. These elements are arranged

to make up the complete I²C transactions as shown in Figure 2 and Figure 3. Figure 2 is a write transaction while Figure 3 is read transaction. The 7-bit I²C slave address of the ICS874208I is a combination of a 4-bit fixed addresses and two variable bits which are set by the hardware pins ADR[1:0] (binary 11010, ADR1, ADR0). Bit 0 of slave address is used by the bus controller to select either the read or write mode. The hardware pins ADR1 and ADR0 should be individually set by the user to avoid address conflicts of multiple ICS874208I devices on the same bus.

Table 3D. I²C Slave Address

7	6	5	4	3	2	1	0
1	1	0	1	0	ADR1	ADR0	R/W

Figure 1: Standard I²C Transaction

START (ST) – defined as high-to-low transition on SDA while holding SCL HIGH.

DATA – between START and STOP cycles, SDA is synchronous with SCL. Data may change only when SCL is LOW and must be stable when SCL is HIGH.

ACKNOWLEDGE (AK) – SDA is driven LOW before the SCL rising edge and held LOW until the SCL falling edge.

STOP (SP) – defined as low-to-high transition on SDA while holding SCL HIGH

Figure 2: Write Transaction

Figure 3: Read Transaction

- S** – Start or Repeated Start
- W** – R/~W is set for Write
- R** – R/~W is set for Read
- A** – Ack
- DevAdd** – 7 bit Device Address
- RegAdd** – 8 bit Register Address, MSB = Q7 and LSB = Q0
- P** – Stop

Absolute Maximum Ratings

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Item	Rating
Supply Voltage, V_{DD}	4.5V
Inputs, V_I	-0.5V to $V_{DD} + 0.5V$
Outputs, I_O (LVDS) Continuos Current Surge Current	10mA 15mA
Package Thermal Impedance, θ_{JA}	33.1°C/W (0 mps)
Storage Temperature, T_{STG}	-65°C to 150°C
Maximum Junction Temperature, T_{JMAX}	125°C
ESD - Human Body Model; NOTE 1	2000V
ESD - Charged Device Model; NOTE 1	500V

NOTE 1: According to JEDEC/JESD 22-A114/22-C101. ESD ratings are target specifications.

DC Electrical Characteristics

Table 4A. Power Supply DC Characteristics, $V_{DD} = V_{DDO} = 2.5V \pm 5\%$, $T_A = -40^\circ C$ to $85^\circ C$

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units

		at $f_{REF} = 100MHz$	48	50	52	%
		at $f_{REF} = 125MHz$	48	50	52	%
		at $f_{REF} = 156.25MHz$	48	50	52	%
t_{PDZ}	Output Enable and Disable Time; NOTE 7	Output enable/disable state from/to active/inactive			1	μs
t_R / t_F	Output Rise/ Fall Time	20% to 80%	200	422	650	ps

NOTE: Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500 lfm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

NOTE 1: Measured from the differential input crossing point to the differential output crossing point.

NOTE 2: Defined as skew between outputs at the same supply voltage and with equal load conditions. Measured at the differential cross points.

NOTE 3: This parameter is defined in accordance with JEDEC Standard 65.

NOTE 4: Defined as skew between outputs on different devices operating at the same supply voltage, same temperature, same frequency and with equal load conditions. Using the same type of inputs on each device, the outputs are measured at the differential cross points.

NOTE 5: Part-to-part skew specification does not guarantee divider synchronization between devices

NOTE 6: If FSEL[1:0] = 00 (divide-by-one), the output duty cycle will depend on the input duty cycle.

NOTE 7: Measured from SDA rising edge of I²C stop command.

Additive Phase Jitter

The spectral purity in a band at a specific offset from the fundamental compared to the power of the fundamental is called the ***dBc Phase Noise***. This value is normally expressed using a Phase noise plot and is most often the specified plot in many applications. Phase noise is defined as the ratio of the noise power present in a 1Hz band at a specified offset from the fundamental frequency to the power value of the fundamental. This ratio is expressed in decibels (dBm) or a ratio

of the power in the 1Hz band to the power in the fundamental. When the required offset is specified, the phase noise is called a ***dBc*** value, which simply means dBm at a specified offset from the fundamental. By investigating jitter in the frequency domain, we get a better understanding of its effects on the desired application over the entire time record of the signal. It is mathematically possible to calculate an expected bit error rate given a phase noise plot.

Additive Phase Jitter (100MHz)

Measured using a Rohde & Schwarz SMA100 as the input source.

Additive Phase Jitter (125MHz)

Measured using a Rohde & Schwarz SMA100 as the input source.

Additive Phase Jitter (156.25MHz)

Measured using a Rohde & Schwarz SMA100 as the input source.

Differential Input with Built-In 50Ω Termination Interface

The IN/nIN with built-in 50Ω terminations accept LVDS, LVPECL, CML and other differential signals. Both differential signals must meet the V_{IN} and V_{IH} input requirements. *Figures 4A to 4C* to show interface examples for the IN/nIN input with built-in 50Ω terminations driven by the most common driver types. The input interfaces

suggested here are examples only. If the driver is from another vendor, use their termination recommendation. Please consult with the vendor of the driver component to confirm the driver termination requirements.

Figure 4B: IN/nIN Input with Built-In 50Ω Driven by a CML Driver with Open Collector

VFQFN EPAD Thermal Release Path

In order to maximize both the removal of heat from the package and the electrical performance, a land pattern must be incorporated on the Printed Circuit Board (PCB) within the footprint of the package corresponding to the exposed metal pad or exposed heat slug on the package, as shown in Figure 5. The solderable area on the PCB, as defined by the solder mask, should be at least the same size/shape as the exposed pad/slug area on the package to maximize the thermal/electrical performance. Sufficient clearance should be designed on the PCB between the outer edges of the land pattern and the inner edges of pad pattern for the leads to avoid any shorts.

While the land pattern on the PCB provides a means of heat transfer and electrical grounding from the package to the board through a solder joint, thermal vias are necessary to effectively conduct from the surface of the PCB to the ground plane(s). The land pattern must be connected to ground through these vias. The vias act as “heat pipes”. The number of vias (i.e. “heat pipes”) are application specific

and dependent upon the package power dissipation as well as electrical conductivity requirements. Thus, thermal and electrical analysis and/or testing are recommended to determine the minimum number needed. Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern. It is recommended to use as many vias connected to ground as possible. It is also recommended that the via diameter should be 12 to 13mils (0.30 to 0.33mm) with 1oz copper via barrel plating. This is desirable to avoid any solder wicking inside the via during the soldering process which may result in voids in solder between the exposed pad/slug and the thermal land. Precautions should be taken to eliminate any solder voids between the exposed heat slug and the land pattern. Note: These recommendations are to be used as a guideline only. For further information, please refer to the Application Note on the Surface Mount Assembly of Amkor's Thermally/Electrically Enhance Leadframe Base Package, Amkor Technology.

Figure 5: P.C. Assembly for Exposed Pad Thermal Release Path – Side View (drawing not to scale)

Recommendations for Unused Input and Output Pins

Inputs:

LVCMOS Control Pins

All control pins have internal pullups or pulldowns; additional resistance is not required but can be added for additional protection. A 1k Ω resistor can be used.

Outputs:

LVDS Outputs

All unused LVDS output pairs can be either left floating or terminated with 100 Ω across. If they are left floating, there should be no trace attached.

LVDS Driver Termination

For a general LVDS interface, the recommended value for the termination impedance (Z_T) is between 90Ω and 132Ω . The actual value should be selected to match the differential impedance (Z_0) of your transmission line. A typical point-to-point LVDS design uses a 100Ω parallel resistor at the receiver and a 100Ω differential transmission-line environment. In order to avoid any transmission-line reflection issues, the components should be surface mounted and must be placed as close to the receiver as possible. IDT offers a full line of LVDS compliant devices with two types of output structures: current source and voltage source. The

standard termination schematic as shown in *Figure 6A* can be used with either type of output structure. *Figure 6B*, which can also be used with both output types, is an optional termination with center tap capacitance to help filter common mode noise. The capacitor value should be approximately 50pF . If using a non-standard termination, it is recommended to contact IDT and confirm if the output structure is current source or voltage source type. In addition, since these outputs are LVDS compatible, the input receiver's amplitude and common-mode input range should be verified for compatibility with the output.

LVDS Termination

Power Considerations

This section provides information on power dissipation and junction temperature for the ICS874208I. Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the ICS874208I is the sum of the core power plus the power dissipation in the load(s). The following is the power dissipation for $V_{DD} = 2.5V + 5\% = 2.625V$, which gives worst case results.

- Power (core)_{MAX} = $V_{DD_MAX} * (I_{DD_MAX} + I_{DDO_MAX}) = 2.625V * (15mA + 203mA) = \mathbf{572.25mW}$
- Power Dissipation for internal termination R_T
Power (R_T)_{MAX} = $4 * (V_{IN_MAX})^2 / R_{T_MIN} = (1.2V)^2 / 80\Omega = \mathbf{72mW}$

Total Power_{MAX} = 572.25mW + 72mW = **644.25mW**

2. Junction Temperature.

Junction temperature, T_j , is the temperature at the junction of the bond wire and bond pad, and directly affects the reliability of the device. The maximum recommended junction temperature is 125°C. Limiting the internal transistor junction temperature, T_j , to 125°C ensures that the bond wire and bond pad temperature remains below 125°C.

The equation for T_j is as follows: $T_j = \theta_{JA} * Pd_{total} + T_A$

T_j = Junction Temperature

θ_{JA} = Junction-to-Ambient Thermal Resistance

Pd_{total} = Total Device Power Dissipation (example calculation is in section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming no air flow and a multi-layer board, the appropriate value is 33.1°C/W per Table 6 below.

Therefore, T_j for an ambient temperature of 85°C with all outputs switching is:

$$85^\circ\text{C} + 0.644\text{W} * 33.1^\circ\text{C/W} = 106.3^\circ\text{C}. \text{ This is below the limit of } 125^\circ\text{C}.$$

This calculation is only an example. T_j will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).

Table 6. Thermal Resistance θ_{JA} for 32 Lead VFQFN, Forced Convection

θ_{JA} by Velocity			
Meters per Second	0	1	3
Multi-Layer PCB, JEDEC Standard Test Boards	33.1°C/W	28.1°C/W	25.4°C/W
