

General Description

The ICS85214 is a low skew, high performance 1-to-5 Differential-to-HSTL Fanout Buffer and a member of the HiPerClockS™ family of High Performance Clock Solutions from IDT. The CLK0, $\overline{\text{CLK0}}$ pair can accept most standard differential input levels. The single ended CLK1 input accepts LVCMOS or LVTTTL input levels. Guaranteed output and part-to-part skew characteristics make the ICS85214 ideal for those clock distribution applications demanding well defined performance and repeatability.

Features

- Five differential HSTL compatible outputs
- Selectable differential CLK0, $\overline{\text{CLK0}}$ or LVCMOS/LVTTTL clock inputs
- CLK0, $\overline{\text{CLK0}}$ pair can accept the following differential input levels: LVPECL, LVDS, HSTL, HCSL, SSTL
- CLK1 can accept the following input levels: LVCMOS or LVTTTL
- Output frequency up to: 700MHz
- Translates any single-ended input signal to HSTL levels with resistor bias on CLK0 input
- Output skew: 30ps (maximum)
- Part-to-part skew: 250ps (maximum)
- Propagation delay: 1.8ns (maximum)
- 3.3V core, 1.8V output operating supply
- 0°C to 85°C ambient operating temperature
- Industrial temperature information available upon request
- Available in both standard (RoHS 5) and lead-free (RoHS 6) packages

Table 1. Pin Descriptions

Number	Name	Type		Description
1, 2	Q0, $\overline{Q0}$	Output		Differential output pair. HSTL interface levels.
3, 4	Q1, $\overline{Q1}$	Output		Differential output pair. HSTL interface levels.
5, 6	Q2, $\overline{Q2}$	Output		Differential output pair. HSTL interface levels.
7, 8	Q3, $\overline{Q3}$	Output		Differential output pair. HSTL interface levels.
9, 10	Q4, $\overline{Q4}$	Output		Differential output pair. HSTL interface levels.
11	GND	Power		Power supply ground.
12	CLK_SEL	Input	Pulldown	Clock select input. When HIGH, selects differential CLK1 input. When LOW, selects CLK0, $\overline{CLK0}$ inputs. LVCMOS/LVTTL interface levels.
13, 17	nc	Unused		No connect.
14	$\overline{CLK0}$	Input	Pullup	Inverting differential clock input.
15	CLK0	Input	Pulldown	Non-inverting differential LVPECL clock input.
16	CLK1	Input	Pulldown	Single-ended clock input. LVCMOS/LVTTL interface levels.
18	V _{DD}	Power		Positive supply pin.
19	$\overline{CLK_EN}$	Input	Pulldown	Synchronizing clock enable. When LOW, clock outputs follow clock input. When HIGH, Qx outputs are forced low, \overline{Qx} outputs are forced high. LVTTL/LVCMOS interface levels.
20	V _{DDO}	Power		Output supply pin.

NOTE: Pullup and Pulldown refer to internal input resistors. See Table 2, *Pin Characteristics*, for typical values.

Absolute Maximum Ratings

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Item	Rating
Supply Voltage, V_{DD}	4.6V
Inputs, V_I	-0.5V to $V_{DD} + 0.5V$
Outputs, V_{DDO}	-0.5V to $V_{DD} + 0.5V$
Package Thermal Impedance, θ_{JA}	73.2°C/W (0 lfpm)
Storage Temperature, T_{STG}	-65°C to 150°C

DC Electrical Characteristics

Table 4A. Power Supply DC Characteristics, $V_{DD} = 3.3V \pm 5\%$, $V_{DDO} = 1.8V \pm 0.2V$, $T_A = 0^\circ C$ to $85^\circ C$

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
V_{DD}	Positive Supply Voltage		3.135	3.3	3.465	V

NOTE 1: Outputs termination with 50Ω to ground.

AC Electrical Characteristics

Table 5. AC Characteristics, $V_{DD} = 3.3V \pm 5\%$, $V_{DDO} = 1.8V \pm 0.2V$, $T_A = 0^\circ C$ to $85^\circ C$

Parameter	Symbol	Test Conditions	Minimum	Typical	Maximum	Units
f_{MAX}	Output Frequency	CLK0, $\overline{CLK0}$			700	MHz
		CLK1			300	MHz
t_{PD}	Propagation Delay; NOTE 1	$f \leq 700MHz$	1.0		1.8	ns
$t_{sk(o)}$	Output Skew; NOTE 2, 4				30	ps
$t_{sk(pp)}$	Part-to-Part Skew; NOTE 3, 4				250	ps
t_R / t_F	Output Rise/Fall Time	20% to 80%	200		700	ps
odc	Output Duty Cycle	CLK0, $\overline{CLK0}$	46		54	%
		CLK1	45		55	%

All parameters measured at f_{MAX} unless noted otherwise.

The cycle to cycle jitter on the input will equal the jitter on the output. The part does not add jitter.

NOTE 1: Measured from either the differential input crossing point or $V_{DD}/2$ to the differential output crossing point.

NOTE 2: Defined as skew between outputs at the same supply voltage and with equal load conditions.

Measured at output differential cross points.

NOTE 3: Defined as skew between outputs on different devices operating at the same supply voltages and with equal load conditions.

Using the same type of inputs on each device, the outputs are measured at the differential cross points.

NOTE 4: This parameter is defined in accordance with JEDEC Standard 65. Parameter Measurement Information

Wiring the Differential Input to Accept Single Ended Levels

Figure 2 shows how the differential input can be wired to accept single ended levels. The reference voltage $V_{REF} = V_{DD}/2$ is generated by the bias resistors R1, R2 and C1. This bias circuit should be located as close as possible to the input pin. The ratio of R1 and R2 might need to be adjusted to position the V_{REF} in the center of the input voltage swing. For example, if the input clock swing is only 2.5V and $V_{DD} = 3.3V$, V_{REF} should be 1.25V and $R2/R1 = 0.609$.

Figure 2. Single-Ended Signal Driving Differential Input

Differential Clock Input Interface

The CLK/ $\overline{\text{CLK}}$ accepts LVDS, LVPECL, LVHSTL, SSTL, HCSL and other differential signals. Both V_{SWING} and V_{OH} must meet the V_{PP} and V_{CMR} input requirements. Figures 3A to 3F show interface examples for the HiPerClockS CLK/ $\overline{\text{CLK}}$ input driven by the most common driver types. The input interfaces suggested here are examples only. Please consult with the vendor of the driver

component to confirm the driver termination requirements. For example, in Figure 3A, the input termination applies for IDT HiPerClockS open emitter LVHSTL drivers. If you are using an LVHSTL driver from another vendor, use their termination recommendation.

Recommendations for Unused Input and Output Pins

Inputs:

LVC MOS Control Pins

All control pins have internal pull-ups or pull-downs; additional resistance is not required but can be added for additional protection. A 1k Ω resistor can be used.

CLK/ $\overline{\text{CLK}}$ INPUTS

For applications not requiring the use of the differential input, both CLK and $\overline{\text{CLK}}$ can be left floating. Though not required, but for additional protection, a 1k Ω resistor can be tied from CLK0 to ground.

CLK INPUT

For applications not requiring the use of a clock input, it can be left floating. Though not required, but for additional protection, a 1k Ω resistor can be tied from the CLK input to ground.

Outputs:

HSTL Outputs

All unused HSTL outputs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

Schematic Example

Figure 4 shows a schematic example of the ICS85214. In this example, the input is driven by an IDT HiPerClockS HSTL driver. The decoupling capacitors should be physically located near the

power pin. For ICS85214, the unused clock outputs can be left floating.

Figure 4. ICS85214 HSTL Buffer Schematic Example

Power Considerations

This section provides information on power dissipation and junction temperature for the ICS85214. Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the ICS85214 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for $V_{DD} = 3.3V + 5\% = 3.465V$, which gives worst case results.

NOTE: Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)_{MAX} = $V_{DD_MAX} * I_{DD_MAX} = 3.465V * 850mA = 227.2mW$
- Power (outputs)_{MAX} = **32.8mW/Loaded Output pair**
If all outputs are loaded, the total power is $5 * 32.8mW = 164mW$

Total Power_{MAX} (3.465V, with all outputs switching) = $227.2mW + 144mW = 391.2mW$

2. Junction Temperature.

Junction temperature, T_j , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS devices is 125°C.

The equation for T_j is as follows: $T_j = \theta_{JA} * Pd_total + T_A$

T_j = Junction Temperature

θ_{JA} = Junction-to-Ambient Thermal Resistance

Pd_total = Total Device Power Dissipation (example calculation is in section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming a moderate air flow of 200 linear feet per minute and a multi-layer board, the appropriate value is 66.6°C/W per Table 6 below.

Therefore, T_j for an ambient temperature of 85°C with all outputs switching is:

$$85^\circ\text{C} + 0.391\text{W} * 66.6^\circ\text{C/W} = 111^\circ\text{C}. \text{ This is well below the limit of } 125^\circ\text{C}.$$

This calculation is only an example. T_j will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (single layer or multi-layer).

Table 6. Thermal Resistance θ_{JA} for 20 Lead TSSOP, Forced Convection

Linear Feet per Minute	θ_{JA} by Velocity		
	0	200	500
Single-Layer PCB, JEDEC Standard Test Boards	114.5°C/W	98.0°C/W	88.0°C/W
Multi-Layer PCB, JEDEC Standard Test Boards	73.2°C/W	66.6°C/W	63.5°C/W

3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

HSTL output driver circuit and termination are shown in *Figure 6*.

Figure 6. HSTL Driver Circuit and Termination

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load.

Pd_H is power dissipation when the output drives high.

Pd_L is the power dissipation when the output drives low.

$$Pd_H = (V_{OH_MAX} / R_L) * (V_{DDO_MAX} - V_{OH_MAX})$$

$$Pd_L = (V_{OL_MAX} / R_L) * (V_{DDO_MAX} - V_{OL_MAX})$$

$$Pd_H = (1.0V / 50\Omega) * (2V - 1.0V) = \mathbf{20mW}$$

$$Pd_L = (0.4V / 50\Omega) * (2V - 0.4V) = \mathbf{12.8mW}$$

$$\text{Total Power Dissipation per output pair} = Pd_H + Pd_L = \mathbf{32.8mW}$$

Reliability Information

Table 7. θ_{JA} vs. Air Flow Table for a 20 Lead TSSOP

Linear Feet per Minute	θ_{JA} by Velocity		
	0	200	500
Single-Layer PCB, JEDEC Standard Test Boards	114.5°C/W	98.0°C/W	88.0°C/W
Multi-Layer PCB, JEDEC Standard Test Boards	73.2°C/W	66.6°C/W	63.5°C/W

Transistor Count

The transistor count for ICS85214 is: 674
