

# Multi-Channel Passive Isolator

## MCR-...CLP-I/I-00

- Electrical isolation without additional power supply
- Current signals 0(4)...20 mA
- 1-, 2- and 4-channel versions

### 1. Description

MCR-1,2,4CLP-I/I-00 passive isolators are used for the electrical isolation and processing of analog 0(4)... 20 mA standard current signals. The blocks provide electrical isolation between the control electronics and process I/O. In addition, interference signals above 75 Hz are effectively suppressed.

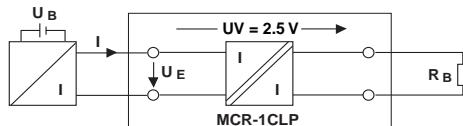

Input and output circuit do not require separate auxiliary power. The modules obtain this power from the input signal.

The modules are snapped onto symmetrical DIN rails in accordance with EN 50 022.

When using passive isolators, ensure that the current-driving voltage of the measuring transducer  $U_B$  is sufficient for driving the maximum current of 20 mA over the passive isolator with the power loss of  $U_V = 2.5$  V and the load  $R_B$ .

This means:

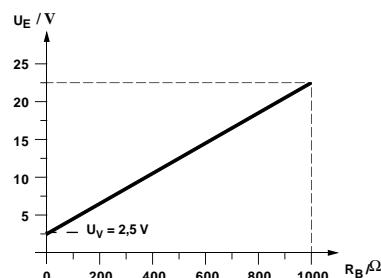

$$U_B \geq U_E = 2.5 \text{ V} + 20 \text{ mA} * R_B$$

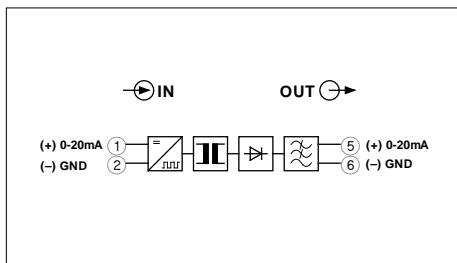

The graphic shows the input voltage of  $U_E$  dependant on the load  $R_B$  considering the power loss  $U_V$ .

If you know your load, the lowest voltage, which the sensor should use to drive a maximum current of 20 mA via passive isolators and loads, can be read from the Y-axis.

Input voltage depending on the load at  $I_A = 20$  mA

## 2. Technical Data

### MCR-1CLP-I/I-00

with signal conversion: 0(4)...20 mA / 0(4)...20 mA  
1-channel

	solid [mm <sup>2</sup> ]	flexible AWG	8
Connection data	0.2-2.5	0.2-2.5	24-14

Description	Output Signal	Module Width
<b>MCR passive isolator,</b> for electrical isolation of current signals without power supply	1-channel	12.5 mm (0.492 in.)

#### Technical Data Per Channel

##### Input

Input signal  
Power loss  
Maximum input current/overload  
Maximum input voltage/overload  
Voltage limitation with zener diode

Type	Order No.	Pcs. Pkt.

EN 55022

Class B

EN 61000 corresponds to IEC 1000/

EN 55022 corresponds to CISPR22

<sup>1)</sup>Criterion A: Normal operating characteristics within the specified limits.

<sup>2)</sup>Criterion B: Temporary adverse effects on the operating characteristics that the device corrects independently.

Class B: Industrial and domestic applications

### 3. Connection Notes

To ensure problem-free operation, the signal source for the passive isolator must supply a sufficiently high voltage:

$$U_S \geq U_{RL} + U_E = U_{RL1} + U_{RL2} + U_T + U_B$$

The maximum load to be driven depends on the input voltage  $U_E$  of the passive isolator.

**Calculation:**

$$URL = U_{RL1} + U_{RL2} = 20 \text{ mA} * R_L \quad R_L = \frac{2 * I}{\gamma * A}$$

$$U_E = U_T + U_B = 2.5 \text{ V} + 20 \text{ mA} * R_B$$

$U_E$  = Input voltage at passive isolator

$U_T$  = Voltage drop at passive isolator

$U_B$  = Voltage drop at output load

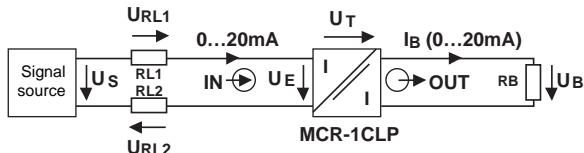

$U_{RL}$  = Voltage drop via both incoming cables

$A$  = Conductor cross-section in  $\text{mm}^2$

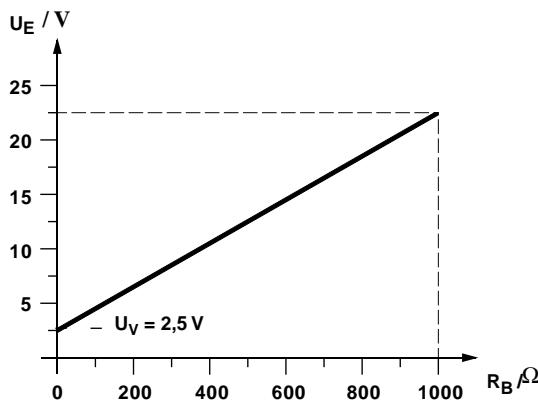

$I$  = Line length between signal source and passive isolator

$\gamma$  = Electr. conductivity [ $\text{Cu} = 56 \text{ m}/\Omega \cdot \text{mm}^2$ ]

$R_B$  = Load impedance

**Input voltage depending on the load at  $I_A = 20 \text{ mA}$**

#### 4. Application Example: Flow Rate Measurement
