### Description

The Harris CD74HC4049 and CD74HC4050 are fabricated with high-speed silicon gate technology. They have a modified input protection structure that enables these parts to be used as logic level translators which will convert high-level logic to a low-level logic while operating off the low-level logic supply. For example 15V input pulse levels can be down-converted to 0V to 5V logic levels. The modified input protection structure protects the input from negative electrostatic discharge. These parts can also be used as simple buffers or inverters without level translation. The CD74HC4049 and CD74HC4050 are enhanced versions of equivalent CMOS types.
