

Voltage Output, High or Low Side Measurement, Bi-Directional Zero-Drift Series CURRENT SHUNT MONITOR

 Check for Samples: [INA199A1](#), [INA199A2](#), [INA199A3](#)

FEATURES

- **WIDE COMMON-MODE RANGE:** -0.3V to 26V
- **OFFSET VOLTAGE:** $\pm 150\mu\text{V}$ (Max)
(Enables shunt drops of 10mV full-scale)
- **ACCURACY**
 - $\pm 1.5\%$ Gain Error (Max over temperature)
 - $0.5\mu\text{V}/^\circ\text{C}$ Offset Drift (Max)
 - $10\text{ppm}/^\circ\text{C}$ Gain Drift (Max)
- **CHOICE OF GAINS:**
 - INA199A1: 50V/V
 - INA199A2: 100V/V
 - INA199A3: 200V/V
- **QUIESCENT CURRENT:** $100\mu\text{A}$ (max)
- **PACKAGES:** SC70, THIN QFN-10

APPLICATIONS

- NOTEBOOK COMPUTERS
- CELL PHONES
- TELECOM EQUIPMENT
- POWER MANAGEMENT
- BATTERY CHARGERS
- WELDING EQUIPMENT

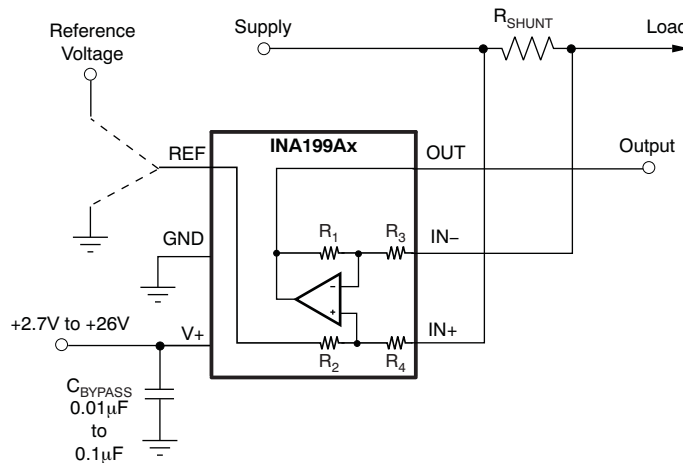

DESCRIPTION

The INA199Ax series of voltage output current shunt monitors can sense drops across shunts at common-mode voltages from -0.3V to 26V , independent of the supply voltage. Three fixed gains are available: 50V/V , 100V/V , and 200V/V . The low offset of the Zero-Drift architecture enables current sensing with maximum drops across the shunt as low as 10mV full-scale.

These devices operate from a single $+2.7\text{V}$ to $+26\text{V}$ power supply, drawing a maximum of $100\mu\text{A}$ of supply current. All versions are specified from -40°C to $+105^\circ\text{C}$, and offered in both SC70 and thin QFN-10 packages.

PRODUCT FAMILY TABLE

PRODUCT	GAIN	R_3 AND R_4	R_1 AND R_2
INA199A1	50	$20\text{k}\Omega$	$1\text{M}\Omega$
INA199A2	100	$10\text{k}\Omega$	$1\text{M}\Omega$
INA199A3	200	$5\text{k}\Omega$	$1\text{M}\Omega$

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

All trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

Output ⁽³⁾		GND – 0.3 to ($V+$) + 0.3	V
Input Current Into All Pins ⁽³⁾		5	mA
Operating Temperature		–40 to +125	°C
Storage Temperature		–65 to +150	°C
Junction Temperature		+150	°C
ESD Ratings:	Human Body Model (HBM)	4000	V
	Charged-Device Model (CDM)	1000	V
	Machine Model (MM)	200	V

(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.

(2) V_{IN+} and V_{IN-} are the voltages at the IN+ and IN– pins, respectively.

(3) Input voltage at any pin may exceed the voltage shown if the current at that pin is limited to 5mA.

ELECTRICAL CHARACTERISTICS

Boldface limits apply over the specified temperature range, $T_A = -40^{\circ}\text{C}$ to $+105^{\circ}\text{C}$.

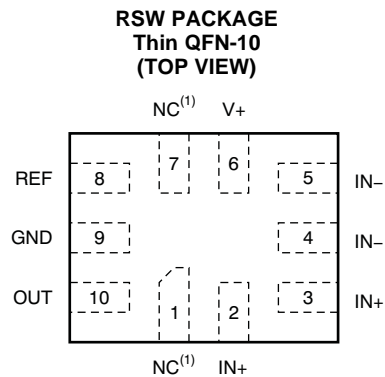

At $T_A = +25^{\circ}\text{C}$, $V_S = +5\text{V}$, $V_{IN+} = 12\text{V}$, $V_{SENSE} = V_{IN+} - V_{IN-}$, and $V_{REF} = V_S/2$, unless otherwise noted.

APPLICATION INFORMATION

BASIC CONNECTIONS

Figure 20 shows the basic connections for the INA199Ax. The input pins, IN+ and IN–, should be connected as closely as possible to the shunt resistor to minimize any resistance in series with the shunt resistance.

Figure 20. Typical Application

Power-supply bypass capacitors are required for stability. Applications with noisy or high-impedance power supplies may require additional decoupling capacitors to reject power-supply noise. Connect bypass capacitors close to the device pins.

On the RSW package, two pins are provided for each input. These pins should be tied together (that is, tie IN+ to IN+ and tie IN– to IN–).

POWER SUPPLY

The input circuitry of the INA199Ax can accurately measure beyond its power-supply voltage, V+. For example, the V+ power supply can be 5V, whereas the load power-supply voltage can be as high as +26V. However, the output voltage range of the OUT terminal is limited by the voltages on the power-supply pin. Note also that the INA199Ax can withstand the full –0.3V to +26V range in the input pins, regardless of whether the device has power applied or not.

SELECTING R_S

The zero-drift offset performance of the INA199Ax offers several benefits. Most often, the primary advantage of the low offset characteristic enables lower full-scale drops across the shunt. For example, non-zero-drift current shunt monitors typically require a full-scale range of 100mV.

The INA199Ax series of current-shunt monitors give equivalent accuracy at a full-scale range on the order of 10mV. This accuracy reduces shunt dissipation by an order of magnitude with many additional benefits.

Alternatively, there are applications that must measure current over a wide dynamic range that can take advantage of the low offset on the low end of the measurement. Most often, these applications can use the lower gain INA199A1 or INA199A2 to accommodate larger shunt drops on the upper end of the scale. For instance, an INA199A1 operating on a 3.3V supply could easily handle a full-scale shunt drop of 60mV, with only 150μV of offset.

UNIDIRECTIONAL OPERATION

Unidirectional operation allows the INA199Ax to measure currents through a resistive shunt in one direction. The most frequent case of unidirectional operation sets the output at ground by connecting the REF pin to ground. In unidirectional applications where the highest possible accuracy is desirable at very low inputs, bias the REF pin to a convenient value above 50mV to get the device output swing into the linear range for zero inputs.

A less frequent case of unipolar output biasing is to bias the output by connecting the REF pin to the supply; in this case, the quiescent output for zero input is at quiescent supply. This configuration would only respond to negative currents (inverted voltage polarity at the device input).

BIDIRECTIONAL OPERATION

Bidirectional operation allows the INA199Ax to measure currents through a resistive shunt in two directions. In this case, the output can be set anywhere within the limits of what the reference inputs allow (that is, between 0V to V+). Typically, it is set at half-scale for equal range in both directions. In some cases, however, it is set at a voltage other than half-scale when the bidirectional current is nonsymmetrical.

The quiescent output voltage is set by applying voltage to the reference input. Under zero differential input conditions the output assumes the same voltage that is applied to the reference input.

INPUT FILTERING

An obvious and straightforward location for filtering is at the output of the INA199Ax; however, this location negates the advantage of the low output impedance of the internal buffer. The only other option for filtering is at the input pins of the INA199Ax; this location requires consideration of the $\pm 30\%$ tolerance of the input impedance. Figure 21 shows a filter placed at the input pins.

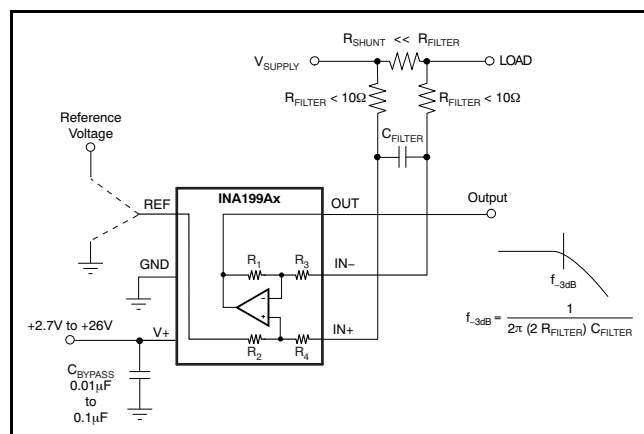

Figure 21. Input Filter

Using the lowest possible resistor values minimizes both the initial shift in gain and effects of tolerance. The effect on initial gain is given by [Equation 1](#):

$$\text{GainError\%} = 100 - [100 \times \{R/(R + R_{\text{FILT}})\}] \quad (1)$$

Where R is the value for R_3 or R_4 from Table 1 for the model in question.

Table 1. Internal Input Resistance Value By Product

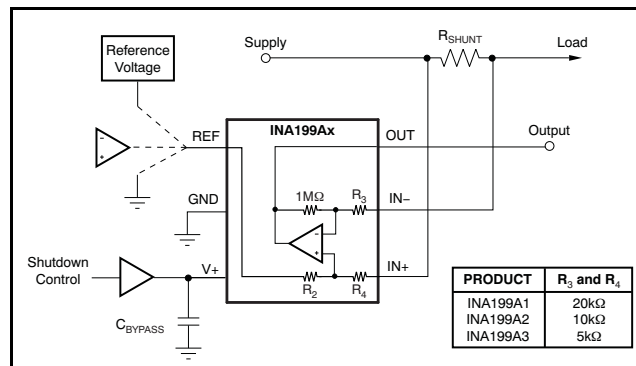

PRODUCT	GAIN	R ₃ AND R ₄
INA199A1	50	20kΩ
INA199A2	100	10kΩ
INA199A3	200	5kΩ

Using an INA199A2, for example, the total effect on gain error can be calculated by replacing the R with $10\text{k}\Omega - 30\%$, (or $7\text{k}\Omega$), or $10\text{k}\Omega + 30\%$ (or $13\text{k}\Omega$). The tolerance extremes of R_{FILT} can also be inserted into the equation. If a pair of 100Ω , 1% resistors are used on the inputs, the initial gain error is approximately 2%.

SHUTTING DOWN THE INA199Ax SERIES

While the INA199Ax series does not have a shutdown pin, the low power consumption allows powering from the output of a logic gate or transistor switch that can turn on and turn off the INA199Ax power-supply quiescent current.

However, in current shunt monitoring applications, there is also a concern for how much current is drained from the shunt circuit in shutdown conditions. Evaluating this current drain involves considering the simplified schematic of the INA199Ax in shutdown mode shown in [Figure 22](#).

NOTE: 1M Ω paths from shunt inputs to reference and INA199Ax outputs.

Figure 22. Basic Circuit for Shutting Down INA199Ax with Grounded Reference

Note that there is typically slightly more than $1\text{M}\Omega$ impedance (from the combination of $1\text{M}\Omega$ feedback and $5\text{k}\Omega$ input resistors) from each input of the INA199Ax to the OUT pin and to the REF pin. The amount of current flowing through these pins depends on the respective ultimate connection. For example, if the REF pin is grounded, the calculation of the effect of the $1\text{M}\Omega$ impedance from the shunt to ground is straightforward. However, if the reference or op amp is powered while the INA199Ax is shut down, the calculation is direct; instead of assuming $1\text{M}\Omega$ to ground, however, assume $1\text{M}\Omega$ to the reference voltage. If the reference or op amp is also shut down, some knowledge of the reference or op amp output impedance under shutdown conditions is required. For instance, if the reference source behaves as an open circuit when it is unpowered, little or no current flows through the $1\text{M}\Omega$ path.

Regarding the $1\text{M}\Omega$ path to the output pin, the output stage of a disabled INA199Ax does constitute a good path to ground; consequently, this current is directly proportional to a shunt common-mode voltage impressed across a $1\text{M}\Omega$ resistor.

As a final note, when the device is powered up, there is an additional, nearly constant, and well-matched $25\mu\text{A}$ that flows in each of the inputs as long as the shunt common-mode voltage is 3V or higher. Below 2V common-mode, the only current effects are the result of the $1\text{M}\Omega$ resistors.

REF INPUT IMPEDANCE EFFECTS

As with any difference amplifier, the INA199Ax series common-mode rejection ratio is affected by any impedance present at the REF input. This concern is not a problem when the REF pin is connected directly to most references or power supplies. When using resistive dividers from the power supply or a reference voltage, the REF pin should be buffered by an op amp.

In systems where the INA199Ax output can be sensed differentially, such as by a differential input analog-to-digital converter (ADC) or by using two separate ADC inputs, the effects of external impedance on the REF input can be cancelled. [Figure 23](#) depicts a method of taking the output from the INA199Ax by using the REF pin as a reference.

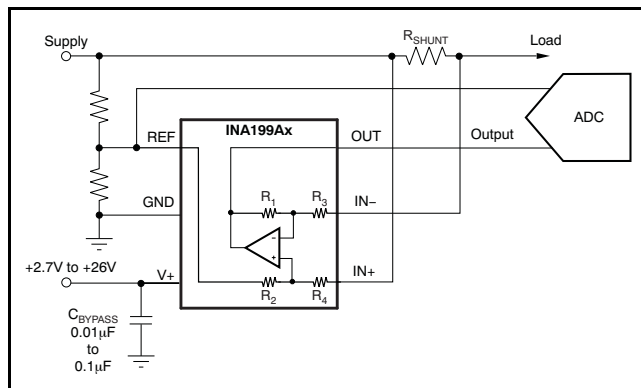

Figure 23. Sensing INA199Ax to Cancel Effects of Impedance on the REF Input

USING THE INA199Ax WITH COMMON-MODE TRANSIENTS ABOVE 26V

With a small amount of additional circuitry, the INA199Ax series can be used in circuits subject to transients higher than 26V, such as automotive applications. Use only zener diode or zener-type transient absorbers (sometimes referred to as *Transzorbs*); any other type of transient absorber has an unacceptable time delay. Start by adding a pair of resistors as shown in [Figure 24](#) as a working impedance for the zener. It is desirable to keep these resistors as small as possible, most often around 10Ω. Larger values can be used with an effect on gain that is discussed in the section on input filtering. Because this circuit limits only short-term transients, many applications are satisfied with a 10Ω resistor along with conventional zener diodes of the lowest power rating that can be found. This combination uses the least amount of board space. These diodes can be found in packages as small as SOT-523 or SOD-523.

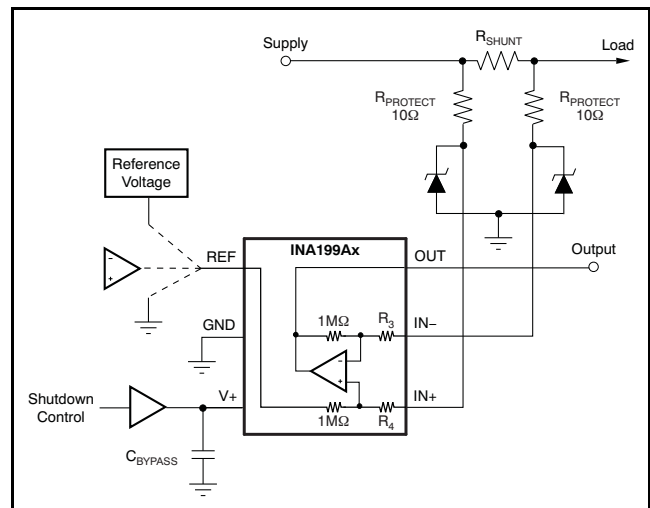

Figure 24. INA199Ax Transient Protection Using Dual Zener Diodes

In the event that low-power zeners do not have sufficient transient absorption capability and a higher power transzorb must be used, the most package-efficient solution then involves using a single transzorb and back-to-back diodes between the device inputs. This method is shown in [Figure 25](#). The most space-efficient solutions are dual series-connected diodes in a single SOT-523 or SOD-523 package. In both examples shown in [Figure 24](#) and [Figure 25](#), the total board area required by the INA199Ax with all protective components is less than that of an SO-8 package, and only slightly greater than that of an MSOP-8 package.

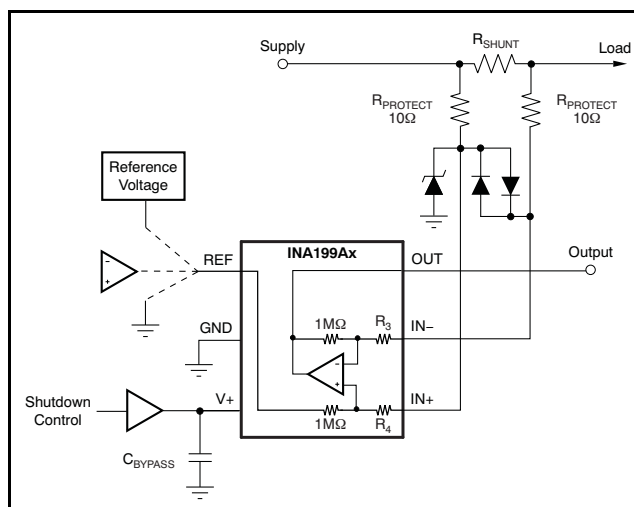

Figure 25. INA199Ax Transient Protection Using a Single Transzorb and Input Clamps

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
